

PREDICTING EMPLOYEE LEAVING

Rawan Alamoud

ABSTRACT

The purpose of this project is to build a classification model that helps the organization predict whether the employee will leave the organization or continue to work for it. I worked with a human resources dataset provided by Kaggle website. First, I started to explore the dataset, then I used Matplotlib and Seaborn tools to visualize the data to help identify the features that led the employees to leave, after that I used Logistic regression and k-nearest neighbors model to predict the employees from the test set that are most likely to leave and then I evaluated each model.

DESIGN

This project helps to figure out which feature has a direct and clear impact on employee leaving and predict whether an employee with a specific profile may leave or not, in order to provide the necessary support to retain the employees and minimize the negative impact on the organization.

DATA

The dataset contains 14,999 data points with 10 features. The features I am using, such as department, number of years the employee has worked in the organization, promotions, relative level of salary, satisfaction level etc. two features are categorical, and the remaining features are of integer and float.

ALGORITHMS

Feature Engineering

Converting categorical features into numerical features

Models

I used Logistic regression and k-nearest neighbors classifiers.

Model Evaluation and Selection

The entire dataset of 14,999 records was split into 80/20 train vs. test. Below is the evaluation of each model.

Logistic regression

- Accuracy: 0.758
- F1: 0.85 retained, 0.31 left

- Precision: 0.79 retained, 0.47 left
- Recall: 0.92 retained, 0.23 left

KNN

- Accuracy: 0.9273
- F1: 0.95 retained, 0.85 left
- Precision: 0.97 retained, 0.81 left
- Recall: 0.94 retained, 0.90 left

TOOLS

- Numpy and Pandas for data processing
- Scikit-learn for modeling
- Matplotlib and Seaborn for visualization

COMMUNICATION

Presentation that includes visuals for communicating the objectives and findings.
